If the pahole is already installed, please run the server again. The application is easy to use and is designed to control the system. The program allows you to measure the quality of grinding of the machine. This program includes several algorithms of grinding and can calculate such important characteristics as the mean square deviation, the distribution of the deviations and so on. Moreover, it is a powerful tool to check the effect of grinding on the processing result. To calculate the mean square deviation of the processing result, you need to enter the measuring points or entire processed workpieces and to choose one of the models of grinding. Then you will be given the mean square deviation which you can compare with the result obtained using the SEM in order to find out if the grinding process is correct. If your grinding produces a higher value of this characteristic, the grinding is not correct. This program also helps to find the best parameters of the grinding process. To do this, the measured characteristics of the grinding process are entered and a search for the best parameters is performed. It is easy to choose the most optimal parameters of grinding. After you choose the parameters, they will be automatically updated in the application. The algorithm of Grinding allows you to carry out measurements in a complex workpiece. It is possible to do this by specifying the cutting direction. Of course, you can specify the grinding area and the number of parameters which you need to control. Thus, you will be able to carry out a local analysis of the grind result. The program calculates such characteristics as the mean square deviation, the mean deviation, the distribution of the deviations, the amount of waste and so on. The software is designed to control the machine or measure the workpiece quality at the workpiece. The software helps to improve the grinding process and to make corrections in the grinding equipment. The program is the modern alternative to the traditional digital profiles. The software allows you to perform the grinding process according to the best parameters, to analyze the grinding results and to compare them with the standards. The algorithm includes several models of grinding and can calculate such important characteristics as the mean square deviation, the distribution of the deviations and so on. It is possible to perform a local analysis of the grinding result or determine the optimal parameters of grinding. The applications consists of the control panel for the machine, the tool holder, the process and the workpiece. The control panel allows you to measure the workpiece quality or to control the machine. It is a convenient and easy-to-use software for controlling the machine, measuring the work 82157476af
